Cambridge CB10 18A, E-mail: barrell@sanger.ac.uk and nhl8sanger.ac.uk
Constructed at the Institute for Genomic Research (TIGR),
Constructed at the Institute for Genomic Research (TIGR),
Constructed at the Institute for Genomic Research (TIGR),
Rockville, MD. Genomic DNA isolated from a cloned population of
Trypansonae bruce; (TREU927/4 GUTat 10.1) was mechanically sheared
to give a tight size distribution (
4 kb). The v + i method used for the library construction is
described in detail in Smith, H. and Venter. J.C. (Making small
insert libraries for whole genome Shotgun sequencing projects.
Genome Sequencing A Practical Approach, eds. M. Vaudin and B.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /nab_nose="Univue"

/note="Wector: Publuescript II SK+; Site_1: EcoRI: Site_2:
XhoI; The CDNA library was constructed from mRNA isolated
from 9-11 day old seedlings that were induced for HR
from 9-11 day old seedlings that were induced for HR
(hypersensitive response) by vacuum infiltrating plant
tissue with Pseudomonas syringae pv. glycinea carrying the
avrB gene (Genetics 141:1597-1604). Plant tissue (expanded
unicoliate leaves) was collected at 2, 4, 8, 12, 24, 36,
and 53 hrs after inoculation and their mRNA pooled equally
for cDNA construction. The library was prepared using the
Stratagene pBhuescript II SK(+) library construction kit.
Complementary DNA was synthesized from mRNA using a primer
consisting of a poly(dT) sequence with an XhoI restriction
sitch. EcoRI adaptors were ligated to the blunt-ended cDNA
fragments followed by XhoI digestion. The CDNA insert is
protected from XhoI digestion via methylation during first
strand synthesis. The CDNA fragments were directionally
cloned into the EcoRI-XhoI restriction site of the
pBluescript vector. The ligated cDNA fragments were
transformed into Ecoli ElectroMax DHIOB host cells. Plant
care, incoculations, and library construction were
performed by Steve Clough (Lila Vodkin lab, University of
Illinois).

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                          US-09-882-694A-2

                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RESULT 13
US-09-103-840A-1/C
IS-09-103-840A-1/C
Sequence 1, Application US/09103840A
Patent No. 624438
GENERAL INFORMATION:
APPLICANT: FILEISCHMAN, Robert D.
APPLICANT: FILEISCHMAN, Robert D.
APPLICANT: WHITE, Owen R.
TITLE OF INVENTION: DNA SEQUENCES FOR STRAIN ANALYSIS IN MYCOBACTERIUM
TITLE OF INVENTION: USBECOLOSIS
FILE REFERENCE: 4366-2007.00
CURRENT FILING DATE: 1998-06-24
NUMBER OF SEQ ID NOS: 2
SOFTWARE: Patentin Ver. 2.1
SEQ ID NO 1
LENTH: 4411529
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

the patent discloses novel polynucleotides encoding Exophiala spinifera fumonisin degradative or transport enzymes such as flavin monocygenase, aldehydrogenase, permease and p-glycoprotein. A fumonisin esterase enzyme with at least one fermease and p-glycoprotein. A fumonisin esterase cargine and processing of the present in the action of a structurally related mycotoxin present in harvested grain, on application to a plant or to harvested grain of processed grain that is to be used as animal or human feed, or as a silage. Nucleotide fragments of the present invention are useful as processed grain era process and primers. They can be introduced into microorganisms that multiply on plants to deliver enzymes to potential target crops. The genes encoding the degrading enzymes are introduced via a vector into a microbial host and the transformed host is supplied to the environment, plants or animals for reducing the pathogenicity of a fungus producing fumonisin. The genes of the invention are fermented in a bacterial host and the resulting bacteria is processed and used as a microbial spray. The nucleotide sequences or other organisms to metabolise fumonisin to engineer microbes or other organisms to metabolise fumonisin and resist its toxic effects.

The present sequence is a genomic DNA encoding Exophala spinifera
                                                                                                                                                                                                                                                                                                                        Fumonisin; degradative enzyme; transport enzyme; flavin monooxygenase; aldehyde dehydrogenase; permease; p-glycoprotain; fumonisin esterase; adetoxification; mycotoxin; animal feed; human feed; silage; transgenic plant; transgenic animal; microbial spray; ds.
